

October 4, 1956

Dear Bruce

Hasty reply to your hasty of the 1st.

Thanks for the page references. I've had galleys on "Linear...." but pages won't be ready for several weeks. It will be volume 41 No. 6. I will notify promptly when pages are available in the hope they can still be ~~inserted~~ inserted.

—Just saw Jim Crow; he still had the galleys of Linear, and has now corrected the Stocker reference.--

The total reprint order for SZL was (according to your letter of 9 Oct 1953) 1025, which were distributed: 600 UW; 100 NDZ; 325 BADS.

I have run out completely, and would very much like to have some more if you can spare (I saved a few copies for distribution to future lab people, but have refused a sprinkling of requests that come in now and then.)

-150

You can expect about 100 requests from US, I think. Most of my mailings are on a regular exchange. There may be an augmented audience owing to the cross-reference in the two papers. (Do you think you can save about 20 copies for us here?—reciprocally, of course—).

Yes, I know Clayton's work on phototaxis: Delbruck had a beautifully illustrated article on it a few years ago (ca. 1952) in Scientific American. The description agrees with what Jennings meant by "apobatic", I think. [Rothschild has a little discussion of chemotaxis in his new book too].

Did you attend or hear about a session on "aging" last week at the Royal Institution? There was to have been a part on aging of bacteria—do you know anything about that? (or was it on aging of bacterial cultures).

Sincerely,

Joshua Lederberg
